

Presentation Outline

- Introduction
 - mode awareness
 - approach
 - theory/methodology
- Case study 1
 - vertical A/P modes
- Means of compensation
 - display augmentation

Formal Analysis of Human-Automation Interaction
The Problem of Display Correctness

Mode Awareness

- **Operational**
 - field data
- **Training**
 - teaching AFCS modes
- **Procedures**
 - custom AFCS procedures
- **Regulatory and Certification**
 - Abbott et al.

Industry/Research contributions

- **Field studies**
 - Wiener, 1985, 1989; Degani, 1996
- **Experimental studies**
 - Sarter and Woods, 1992, 1994, 1997
- **Incident analysis**
 - Rogers et al.; Mangold and Eldredge; Vakil et al.
- **Cognitive studies**
 - Irving et al.; Hutchins; Javaux and de-Keyser
- **Training**

Analysis of Human-Machine Interfaces

■ Assumptions:

- machine behavior is given
- control panel is given
- “perfect” pilot
- task specification and activities are given

■ Display correctness aspects

- quantitative (what info.)
- qualitative (how this info. is displayed)

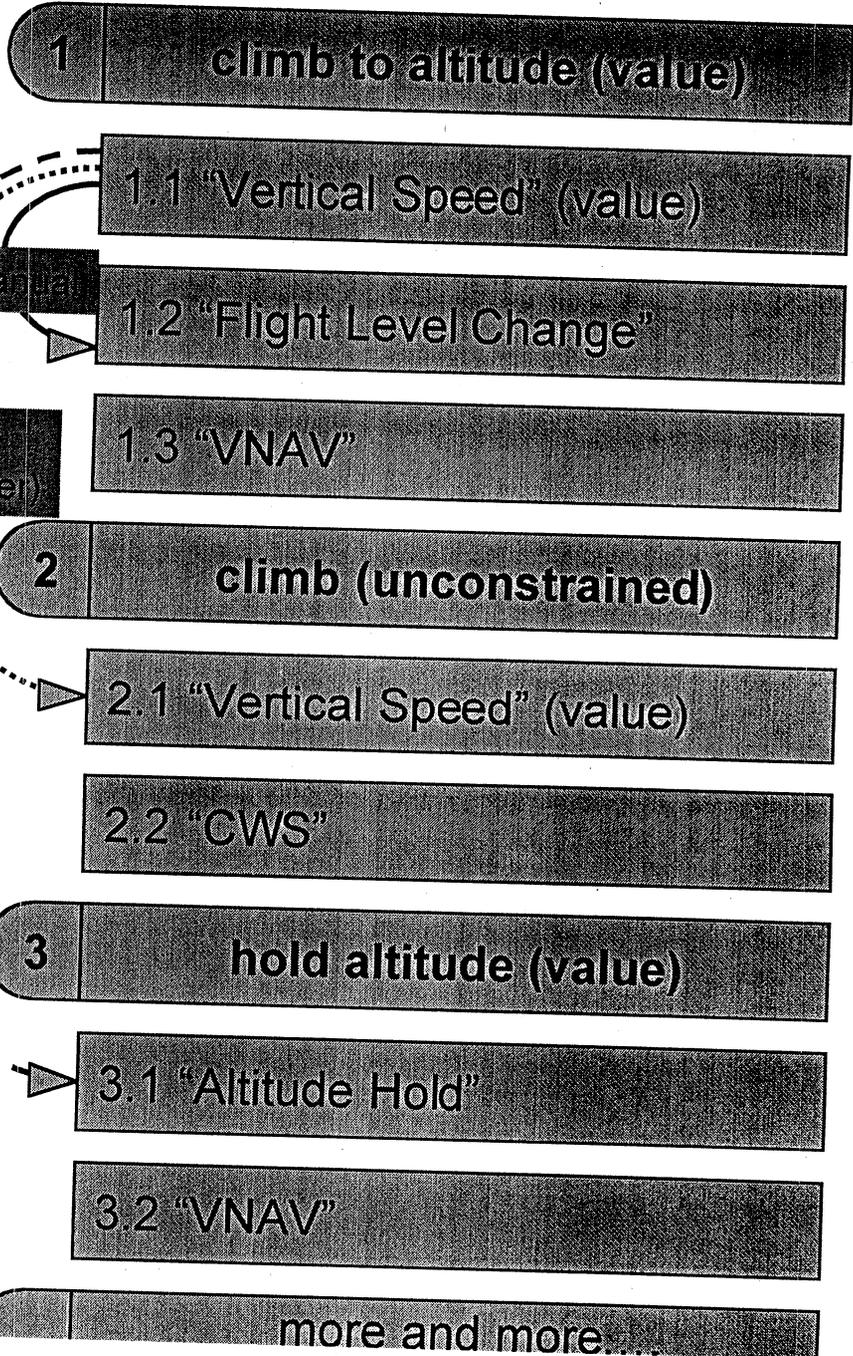

Research Objectives

- Develop methodology for evaluation of display correctness
 - consistency with training materials
- Develop methodology for display synthesis
 - correct
 - succinct
 - reliable

Approach

- Analytical
 - theory
 - methodology for evaluation and synthesis
- Systematic
 - formal
 - model based
- Specification driven
 - specified activities

specified activities

■ For every situation, where are we on the list?

- mode
- parameters

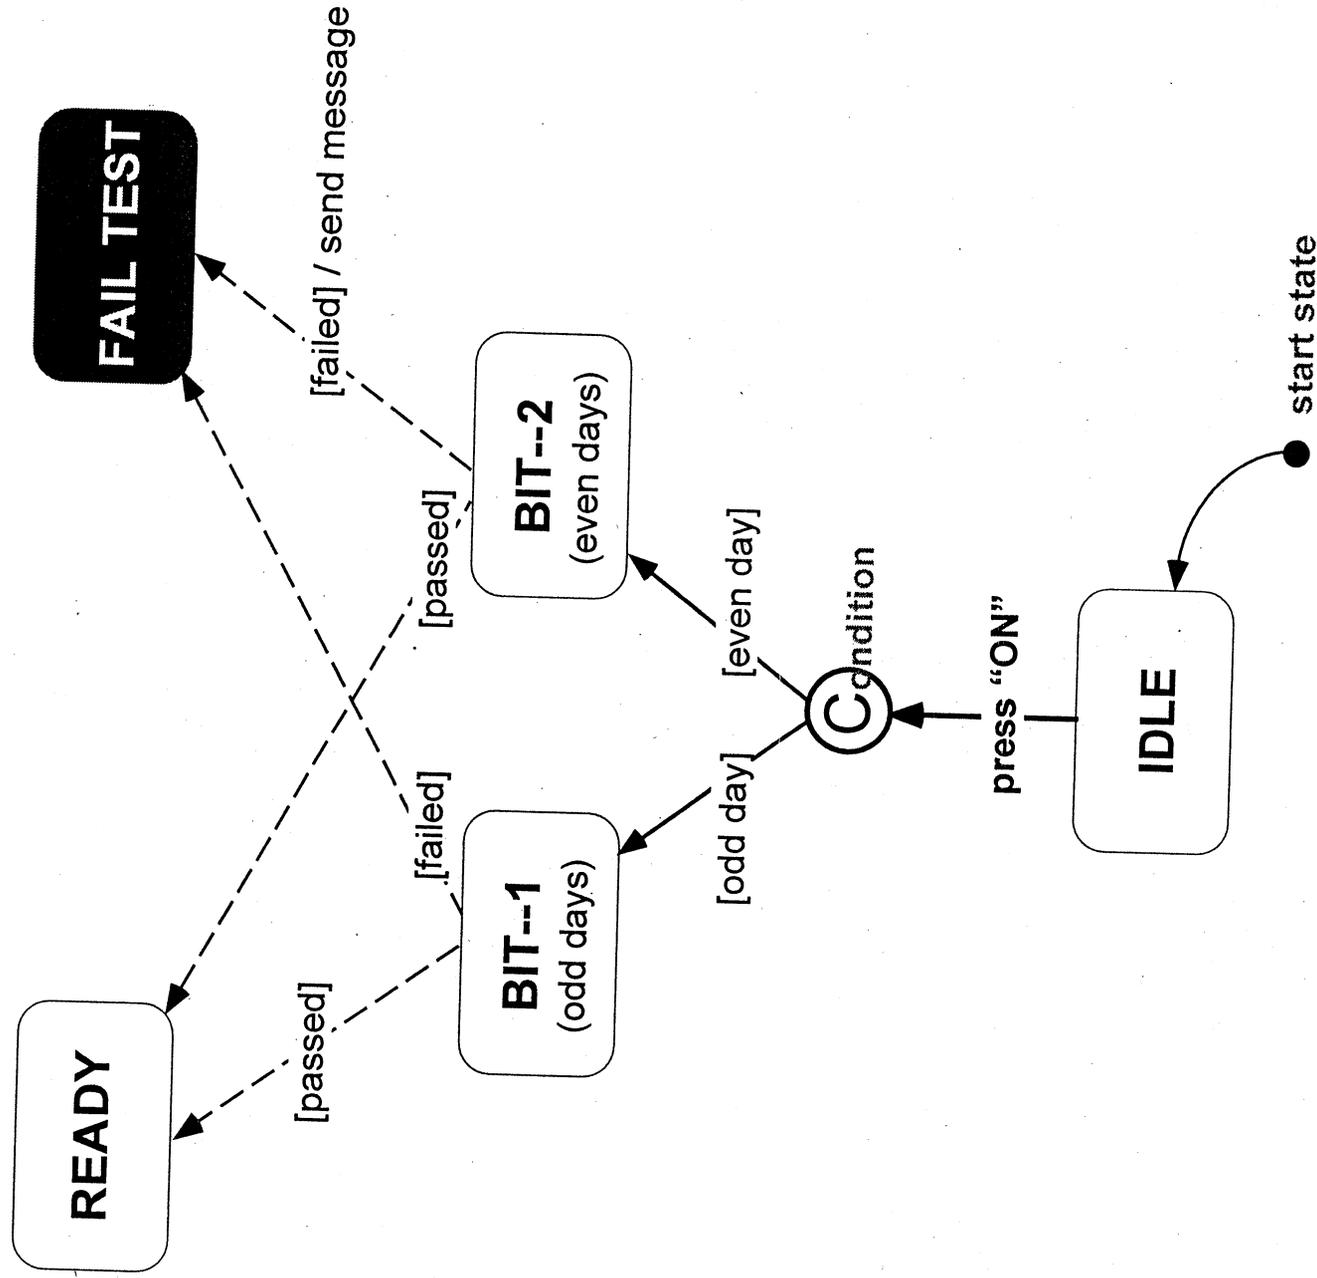

■ For every possible pilot interaction, where will we be on the list?

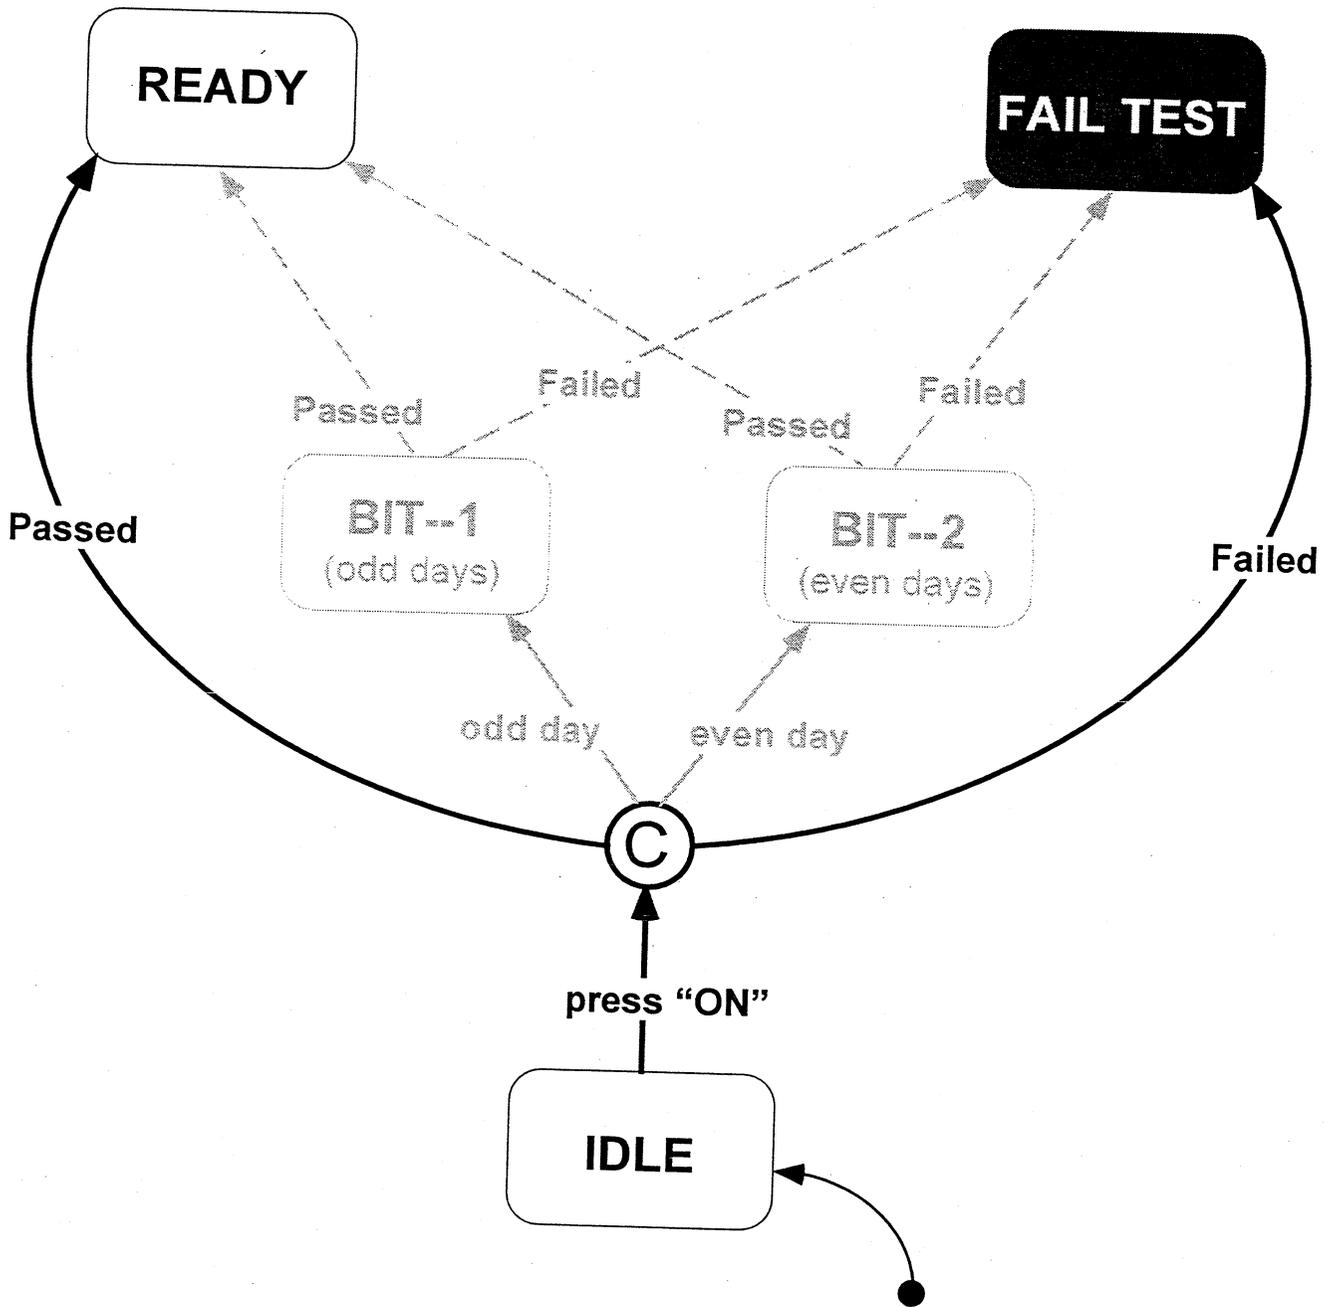

- mode
- parameters

■ For every possible pairs of activities, what pilot interaction is necessary to transition between the pair?

Modeling

- Hybrid machine representation
 - discrete
 - continuous
- Confine the investigation
 - system under study
 - related events
- Reverse Engineering
 - Simulator behavior

Flight Guidance Project

- Is display correctness an existing problem?
- Is our theory/method useful?
- Case studies
 - vertical A/P modes
 - “altitude intervene” function
 - electrical system...

Vertical A/P modes

- Existing system
 - VS, FLCH, ALT_ACCQ, ALT_HLD
- Field data
 - ASRS reports
- Concept of display correctness
 - climb/descent to an altitude
- -> proposed solution

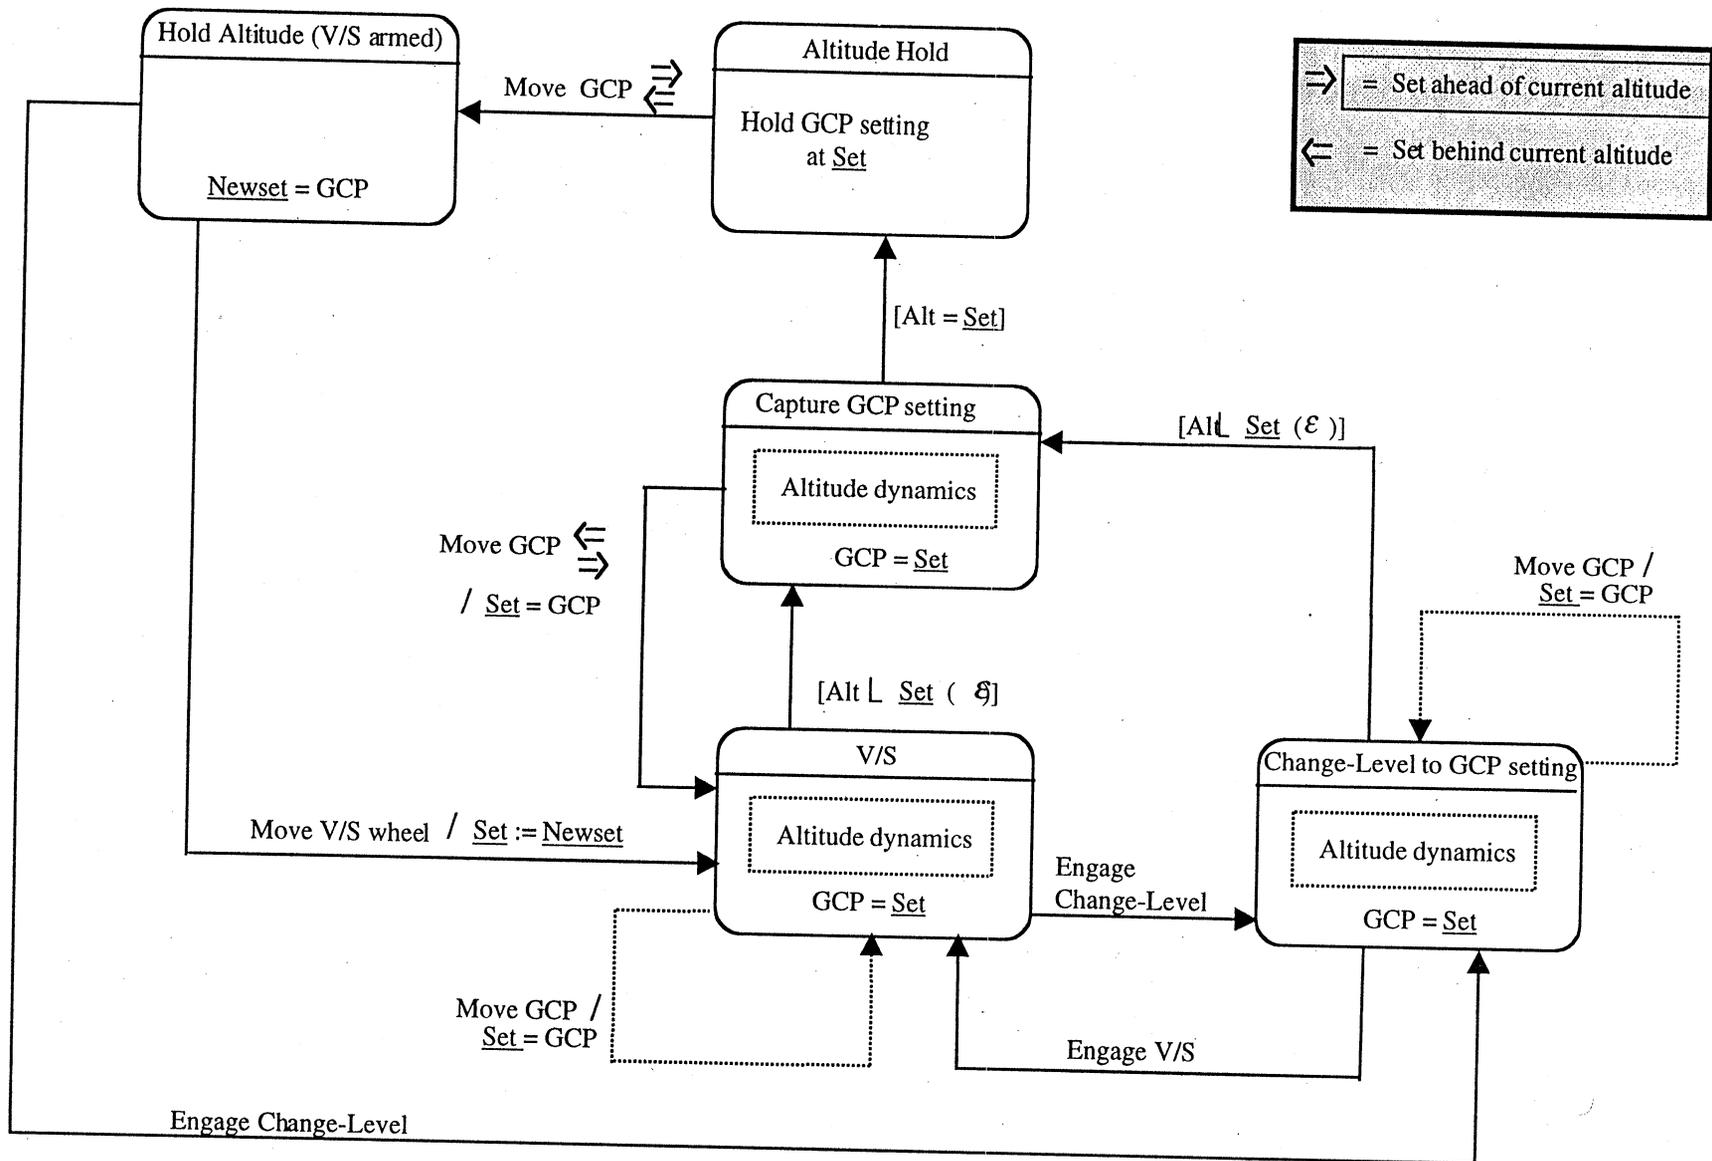

Figure : Vertical Mode Control Model - Training Manual Version

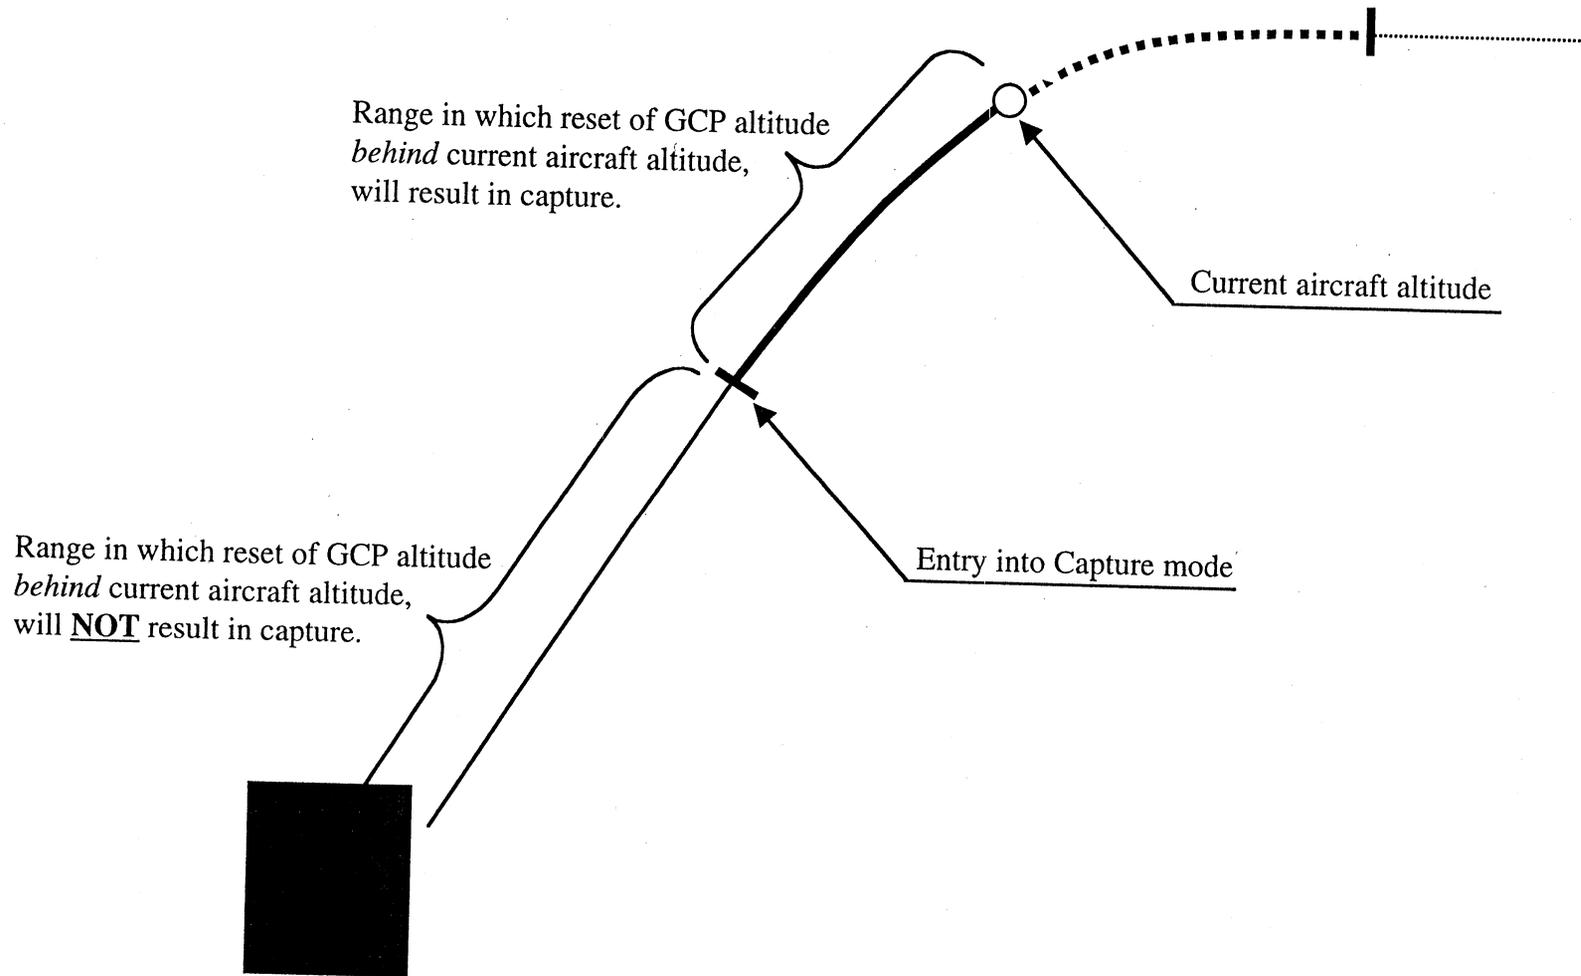

Figure : Capture Profile

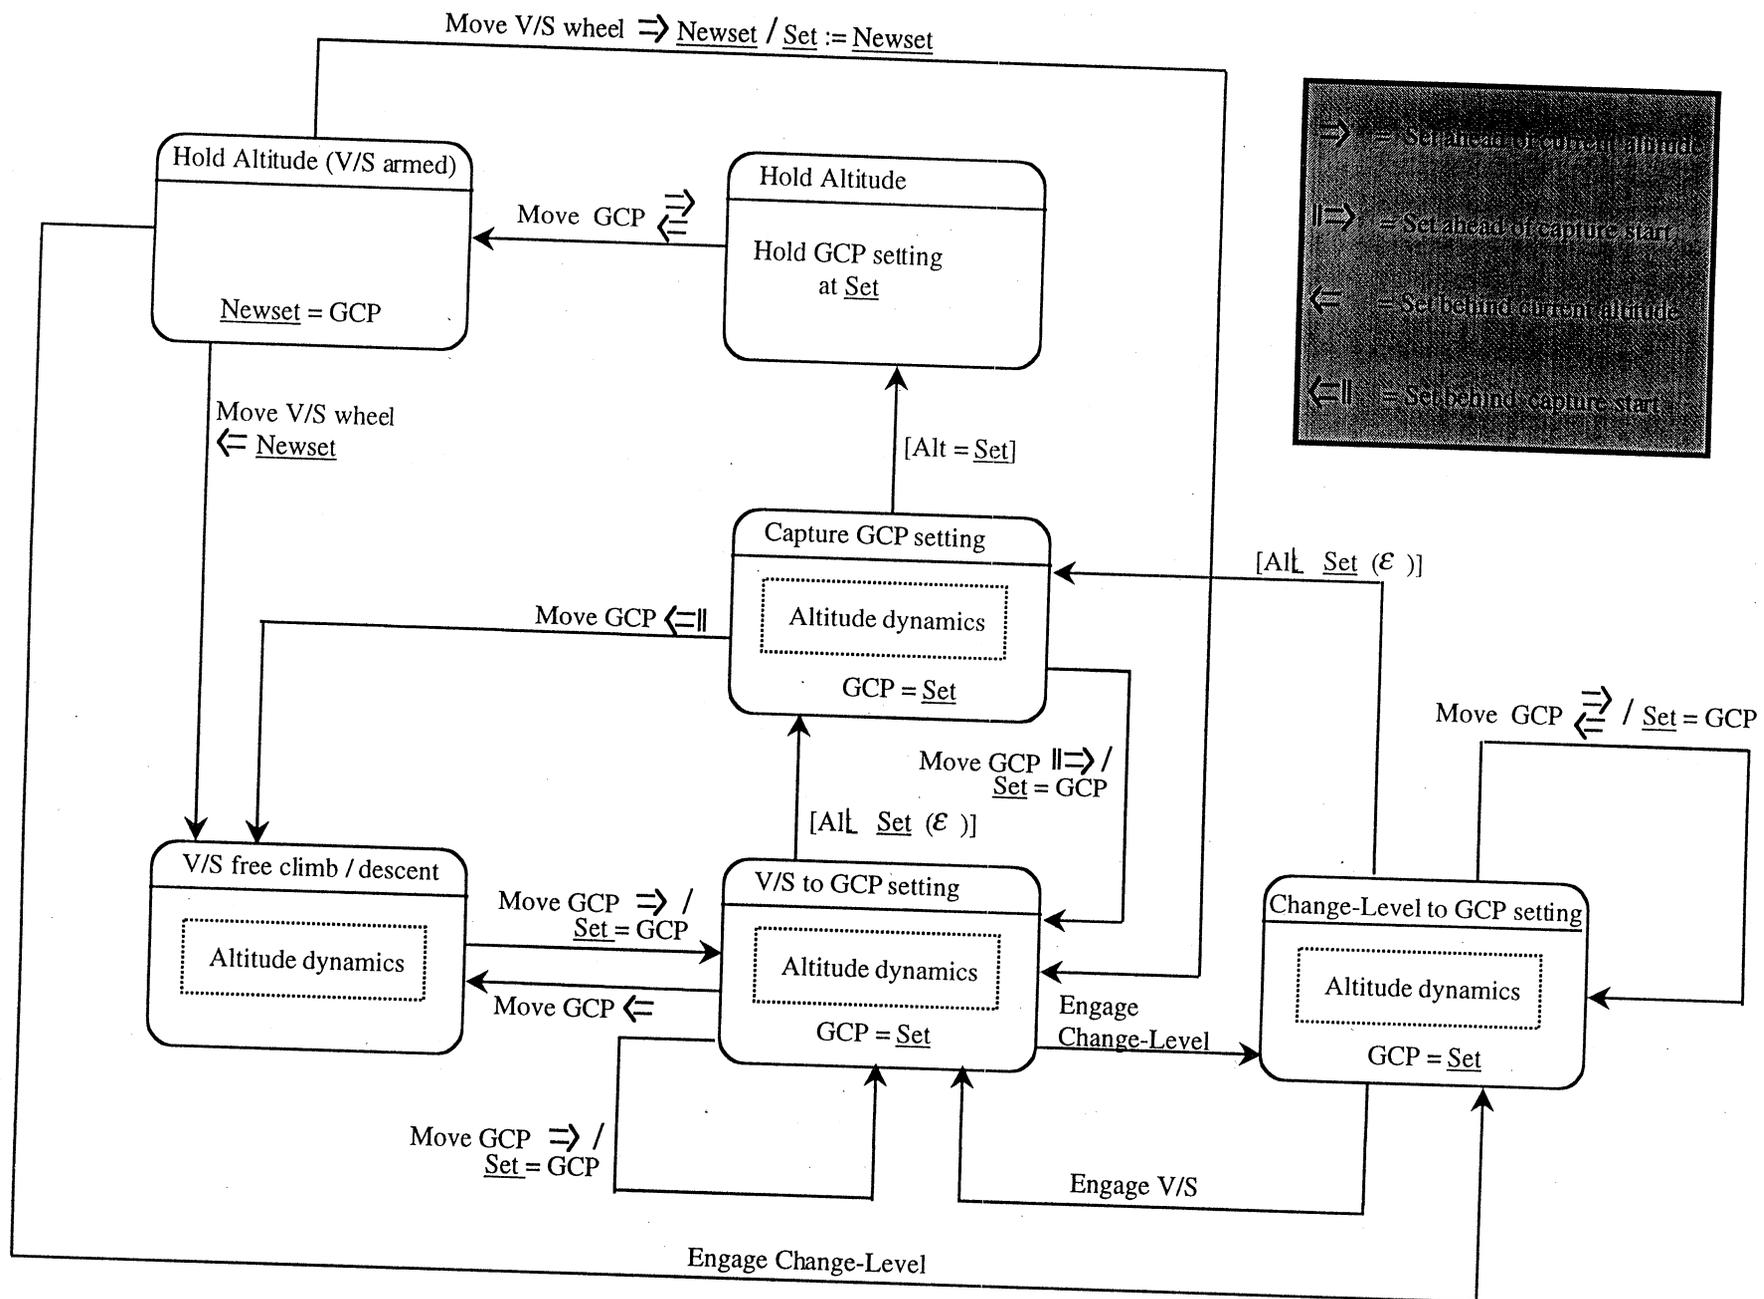

Figure : Vertical Mode Control Model - Actual

Altitude Intervene

- Introduction of *new function* into AFCS
 - focused analysis
- Field data
 - none
- Process of doing an evaluation
 - profile
 - model
 - analysis

Process of Evaluation

- Profile
 - climb, cruise, descent
- “Altitude Intervene”
 - no MCP contradiction
- “Altitude Intervene”
 - with MCP contradiction
- -> proposed solution

Limitations

- **Entry assumptions**
 - machine is fixed
 - “perfect pilot”
 - display format and layout
 - crew factors
- **Modeling**
 - state explosion problem
 - input events
 - hybrid systems are not well understood

Conclusions

- Theory
- Methodology
- Examples
- Process of evaluating human-automation interaction

A step in the search for a quantitative method for evaluating autoflight displays
